

Skin Booster Aftercare

Skin Booster After care.

Immediately after your Skin Boost treatment, it is likely that there will be some small red raised weals in the treated area.

This is a normal result of the injections. These symptoms are temporary and generally disappear within a few days - in most cases there is nothing to see after just a few hours, though you may be able to feel the injection site as small bumps. This is normal.

Preferably DON'T TOUCH THE AREA AT ALL FOR A FEW HOURS! BUT....Mineral make-up may be applied immediately and other makeup after 6 hours. Until the initial swelling and redness have resolved, do not expose the treated area to intense heat (e.g sunbeds, saunas, steam rooms, sunbathing) or extreme cold. Avoid alcohol.

A small amount of Arnica Gel may be applied to any bruises up to 4 times a day.

Antihistamines may be taken to reduce swelling.

Remember that Jalupro takes several weeks to have effect as its main role is the stimulating of your own collagen, thus giving a nice natural, youthful appearance, and several treatment courses are recommended.
